# Software Environments on High Performance Computing clusters: Software stacks and containers

*UofM-Spring-Workshop 2023*  
*May 17<sup>th</sup>-19<sup>th</sup>, 2023*

*Ali Kerrache*  
*HPC Analyst*

- ★ Software distribution on HPC clusters:
  - Local installation
  - modules
- ★ Software stacks on Grex
  - GrexEnv
  - CCEnv
- ★ Containers:
  - Singularity
  - **apptainer**

# Software layers

**User layer:** Python packages, Perl and R modules, home made codes, ...

User

**Software stacks:** modules for Intel, PGI, OpenMPI, CUDA, MKL, high-level applications. Multiple architectures (sse3, avx, avx2, avx512)

RSNT

**Nix or gentoo:** GNU libc, autotools, make, bash, cat, ls, awk, grep, etc.

**Gray area:** Slurm, Lustre client libraries, IB/OmniPath/InfiniPath client libraries (all dependencies of OpenMPI) in Nix {or gentoo} layer, but can be overridden using PATH & LD\_LIBRARY\_PATH.

Sys. Admin

**OS:** kernel, daemons, drivers, libcuda, anything privileged (e.g. the sudo command): always local. Some legally restricted software too (VASP).

# Why modules?

## ★ Why modules?

- Control different versions of the same program.
- Avoid conflicts between different versions and libraries.
- Set the right path to each program or library.

## ★ Useful commands for working with modules:

- module **list**; module **avail**
- module **spider** <soft>/<version>
- module **load** soft/version; module **unload {rm}** <soft>/<version>
- module **show** soft/version; module **help** <soft>/<version>
- module **purge**; module --force **purge**
- module **use** ~/modulefiles; module **unuse** ~/modulefiles

```
[someuser@bison]$ module list  
Currently Loaded Modules:  
1) GreXEnv (S)
```

Where:

S: Module is Sticky, requires --force to unload or purge

## ★ Grex environment [default]: GrexEnv

- no module loaded by default.
- use `module spider <name of the software>` to search for modules
- **Compilers:** {GCC, Intel}, MKL, PETSc, ... etc.
- Gaussian, ANSYS, MATLAB, ... etc.

## ★ The Alliance (Compute Canada) environment [optional]: CCEnv

- Switch to CCEnv; load a standard environment; choose the architecture[`sse3`, `avx2`, `avx512`], use `module spider <soft>`

`module load CCEnv`

`module load StdEnv/2020`

`module load arch/avx512`

`module load StdEnv/2020 gcc/9.3.0 geant4/10.7.3`

```
module load StdEnv/2016.4
```

```
module load arch/sse3
```

```
module load nixpkgs/16.09 gcc/5.4.0 geant4/10.05.p01
```

```

- ★ **Alternative for running software:** difficult to build from source
- ★ Possibility to **convert Docker** images to **singularity**.
- ★ **Singularity installed on all clusters** {no Docker for security reasons}
- ★ **Build the image:**
  - module load singularity
  - singularity build qiime2-2021.11.sif docker://quay.io/qiime2/core:2021.11
- ★ **Run the code via singularity:**

```
singularity exec -B $PWD:/home -B /global/scratch/someuser:/outputs \  
-B /global/scratch/someuser/path/to/inputs:/inputs <path to qiime2-2021.11.sif> \  
qiime feature-classifier fit-classifier-naive-bayes \  
--i-reference-reads /outputs/some_output_feature.qza \  
--i-reference-taxonomy /outputs/some_output_ref-taxonomy.qza \  
--o-classifier /outputs/some_output_classifier.qza
```

```
[~@yak ~]$ module load singularity
[~@yak ~]$ singularity build qiime2-2023.3.sif docker://quay.io/qiime2/core:2023.2
INFO: Starting build...
2023/05/15 14:46:02 info unpack layer:
sha256:3f4ca61aafcd4fc07267a105067db35c0f0ac630e1970f3cd0c7bf552780e985
....
INFO: Creating SIF file...
INFO: Build complete: qiime2-2023.3.sif

[~@yak ~]$ module load apptainer
[~@yak ~]$ apptainer build qiime2.sif docker://quay.io/qiime2/core:2023.2
```

**Resources:** [Github](#), [DockerHub](#), SingularityHub, Aptainer.

**Singularity examples:** <https://github.com/singularityware/singularity/tree/master/examples>

- ★ **Documentation:** <https://singularityware.github.io/user-guide.html>
- ★ **DockerHub:** <https://hub.docker.com/explore/>
- ★ **SingularityHub:** <https://www.singularity-hub.org/>
- ★ **Apptainer:** <https://apptainer.org/docs/>

<https://docs.alliancecan.ca/wiki/Singularity/en>  
<https://um-grex.github.io/grex-docs/>

**Access to Singularity:**

- ★ **Connect to cluster:** Grex, cedar, graham, beluga or narval:
- ★ **Load a module:** module load singularity
- ★ **Build the image:** convert the image from Docker to Singularity
- ★ **Note:** You may need to use your own Linux machine or VM to build the image

# Singularity: deprecated message

---

```
[~@beluga2 ~]$ module load singularity
```

-----  
There are messages associated with the following module(s):  
-----

**singularity/3.8:**

This module is deprecated and will be removed in the future due to security reasons.

**Please move to [apptainer/1.1](#)** or, if you use encrypted containers, [apptainer-suid/1.1](#).

Ce module est marqué pour être retiré et sera supprimé dans le futur pour des raisons de sécurité.

**Utilisez plutôt [apptainer/1.1](#)**, ou si vous utilisez des conteneurs cryptés, [apptainer-suid/1.1](#).

-----

- ★ **Tools and basic commands:** Operating system and nix or gentoo layer
- ★ Modules provided from local software stack or from cvmfs
- ★ Restricted software:
  - Restricted cvmfs: ORCA, CFOUR, DL\_POLY, Maker, ...
  - Installed under /opt/software {site license}: Gaussian, VASP, ...
- ★ Modules provided as a collection:
  - StdEnv/2016.4 {Available but not maintained}
  - StdEnv/2018.3 {Available but not maintained}
  - StdEnv/2020 {up to date and maintained}
  - **Preparing for the next environment:** in progress.
- ★ Local installation under user's account: R, Python, Perl, Julia, ...
- ★ Containers: singularity and apptainer
